ABSTRACT

DocuMind AI is a web-based application developed to make document management easier and more efficient. The main goal of this project is to provide a secure platform where users can log in, manage documents, and support future AI-based document analysis and question-answering features.

In the current phase of the project, the requirement analysis and system architecture have been completed. The Login and Sign-Up modules have been developed to provide secure user authentication. A responsive Dashboard has also been created to help users easily access different sections of the application. Reusable frontend components have been implemented to make the application more organized and easier to maintain.

The frontend is developed using React.js, Vite, and Axios, while the backend is developed using FastAPI with JWT authentication for secure user login. The frontend and backend integration is currently in progress.

In the next phase, features such as document upload, document processing, AI integration, vector database, Retrieval-Augmented Generation (RAG), and AI-based question answering will be implemented. These features will allow users to upload documents and receive intelligent responses based on the document content.

Name: Ganji Sri Vishnu Vardhan

Role: Frontend Developer

Week-1: I focused on learning the technologies used in my project (Documind Ai) and understanding how the project works. I explored React, Vite, JavaScript, CSS, React Router, and Axios, and understood how they are used to build the frontend. I also studied the complete workflow of the DocuMind AI project, including document upload, backend processing, and AI response generation. This helped me understand the project requirements and prepared me for frontend development.

Name : Mupalla Meghana

Role: Backend Developer

Week-1:

- Understood the overall DocuMind AI project requirements .
- Learned the basics of FastAPI and backend development concepts.
- Studied REST API development and understood authentication workflows (user login process).
- Learned about document processing and PDF extraction techniques and the fundamentals of Retrieval-Augmented Generation RAG.

Gained an understanding of technical documentation and Collaborated with the team to understand project modules and backend responsibilities.

Name: Ganji Sri Vishnu Vardhan

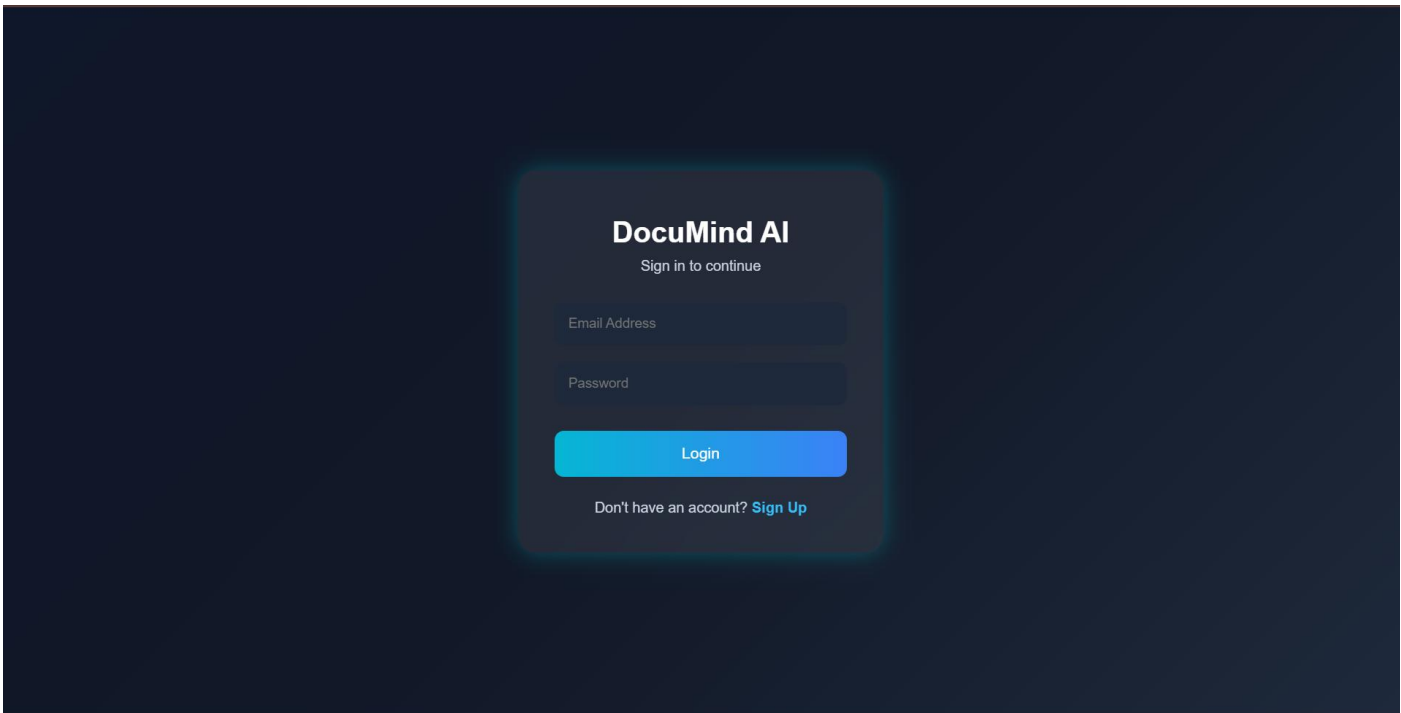

Role: Frontend Developer

Week-2: I started building the frontend of the DocuMind AI project using VS code and I have successfully created the React screen. I created the project architecture and organized the folder structure into components, pages, layouts, and services for better code organization.

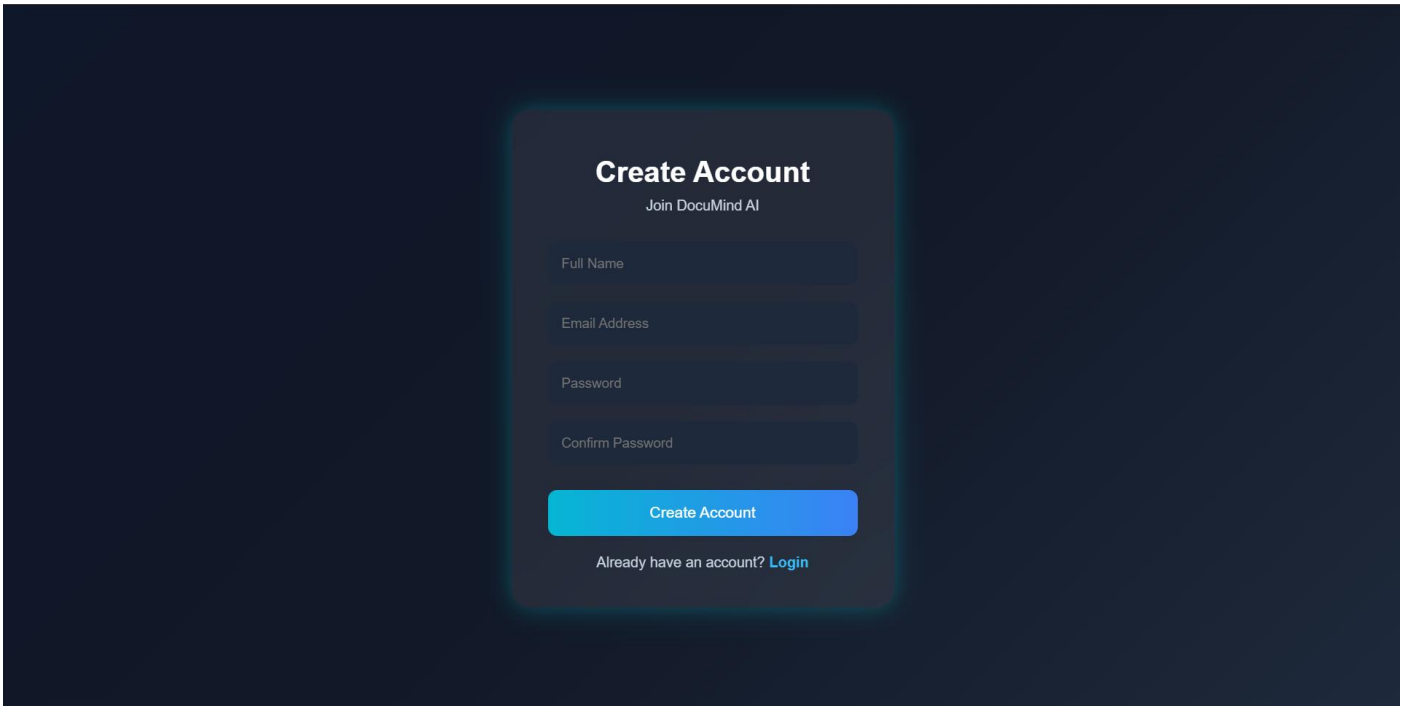

I developed the basic React screens such as Login, Signup, and Dashboard, and created reusable components like the Navbar, Sidebar, Statistics Cards, Upload Card, and AI Assistant section.

I also worked on page navigation using React Router, designed responsive layouts, and added basic form validation for user input. In addition, I prepared the frontend for API integration with the backend and ensured that the application structure was easy to maintain and extend.

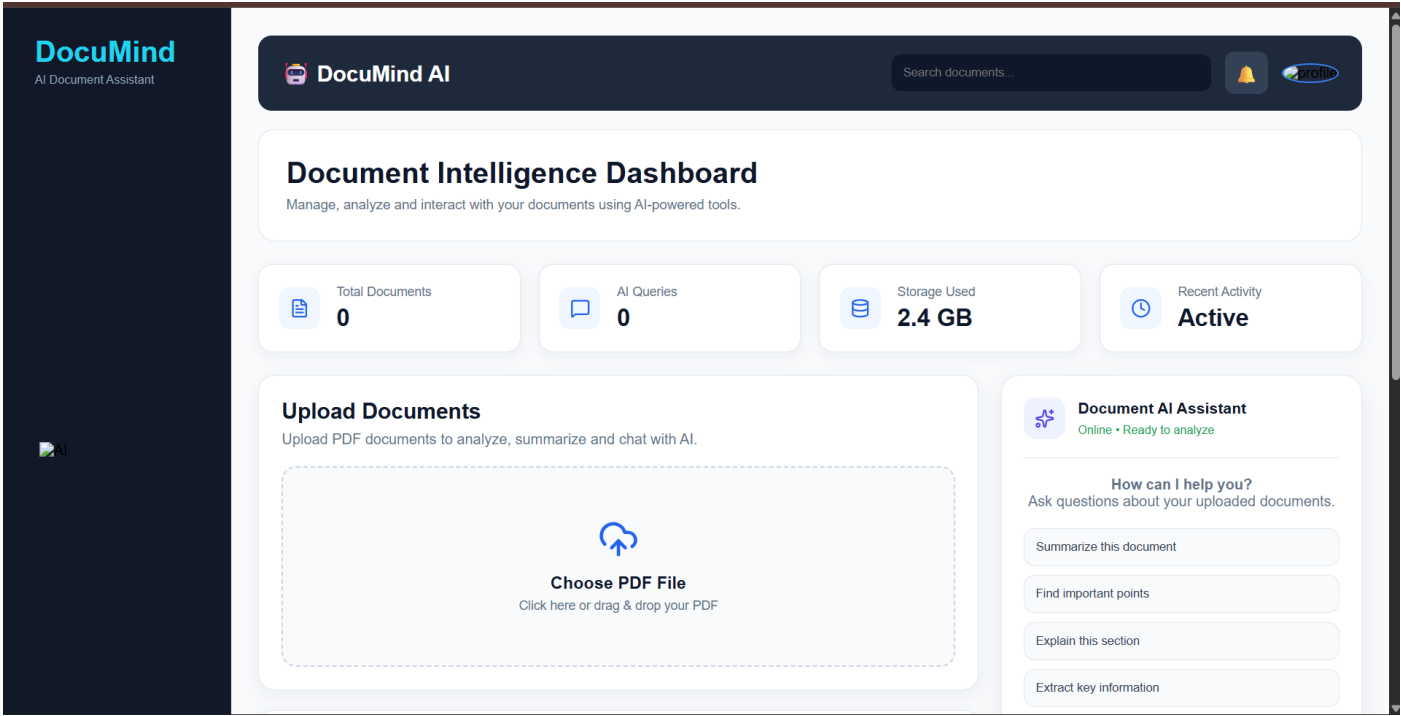

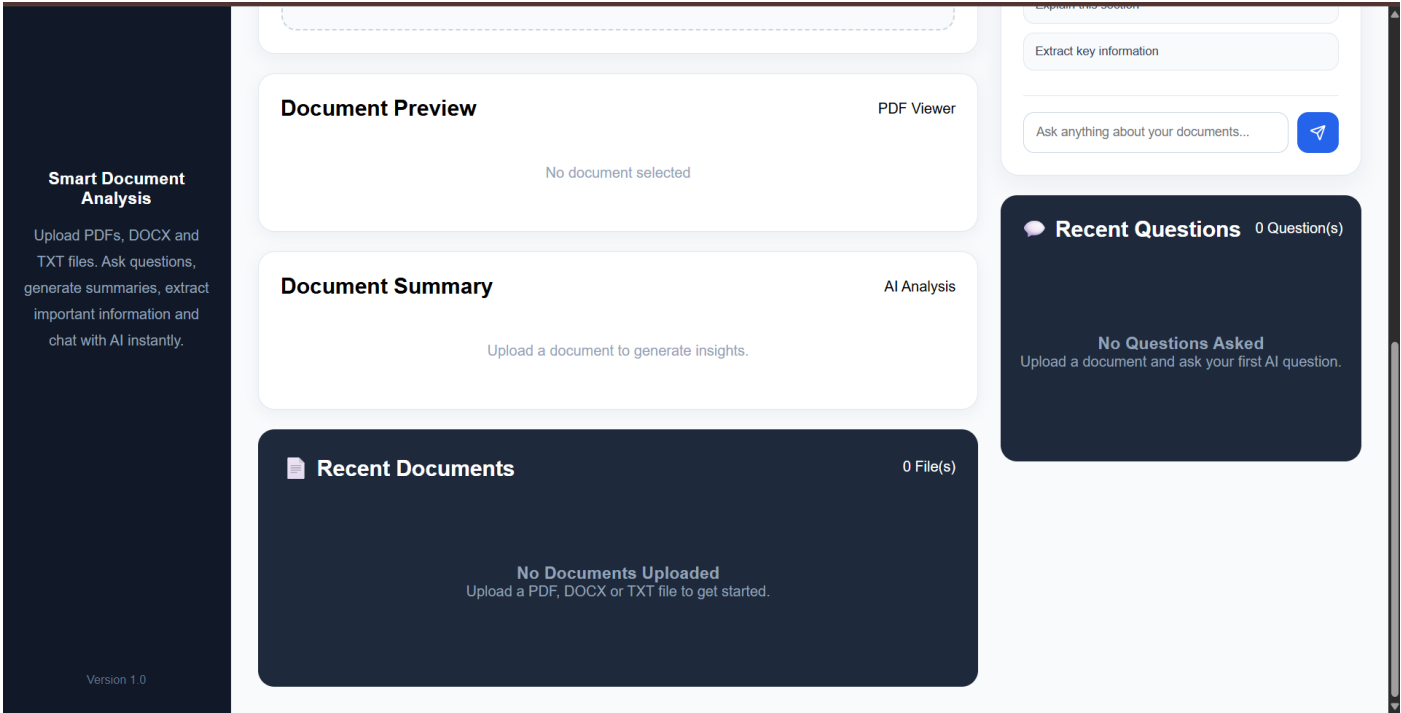

This week helped establish a strong frontend foundation and prepared the project for implementing the remaining features in the upcoming weeks.

Login page

Signup page

Dashboard pages.

Architecture Flow:

User

React Frontend

Components (Navbar, Sidebar, Dashboard)

Pages (Login, Signup, Upload, Search)

React Router (Navigation)

Axios (API Calls)

FastAPI Backend

Database & AI Model

Name: Mupalla Meghana

Role: Backend Developer

Week-2:

Backend Project Setup

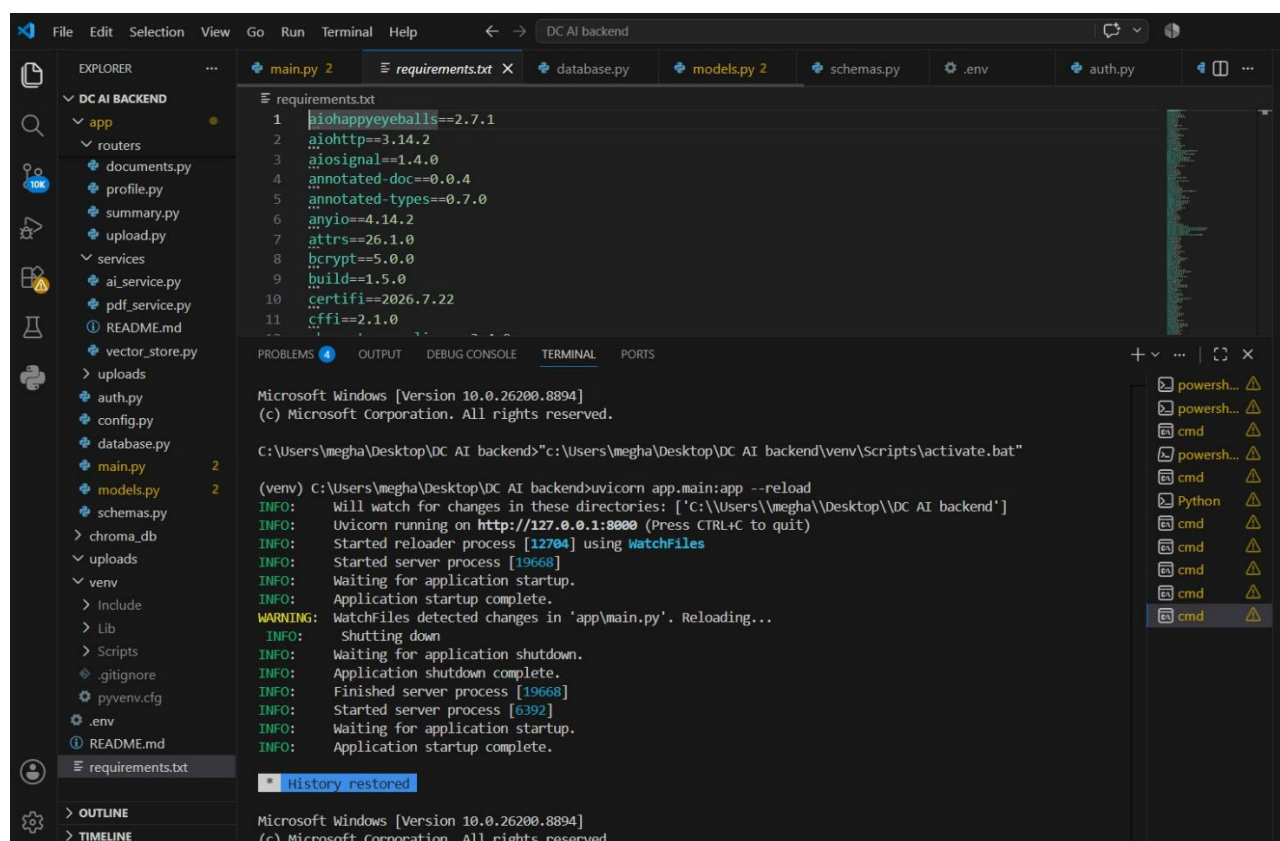

Created the backend project using FastAPI.

Created and configured a Python Virtual Environment (venv).

Installed all required backend dependencies.

Configured the backend development environment.

I have set up using Python in Visual Studio Code (VS Code) with the FastAPI framework. A Python Virtual Environment (venv) was created to manage the project's dependencies separately. The required Python packages and libraries were installed, and the development environment was configured successfully. The project folder structure was organized, and the FastAPI server was tested to ensure the backend was running correctly.
